

HYDROPHILIC WATERSTOP

DC INTERNATIONAL is a well-established Canadian enterprise that manufactures waterstop thermoplastic hydrophilic extrusions. The DC hydrophilic waterstop is specially designed to be installed on site and to block the passage of water through joints in liquid containing tanks or other structures. It has the benefit of PVC waterstop with a hydrophilic component to make joints between concrete elements fully waterproof.

PROPERTIES

The DC hydrophilic waterstop is a material made with PVC and a hydrophilic thermoplastic that provides a controlled expansion to the waterstop when in contact with water. The DC waterstop produces enough swelling pressure to withstand high hydrostatic pressure, even when exposed to salt water. Tests performed under the supervision of UL CLEB demonstrate that the waterstop resists to pressure equivalent to 150 feet of water pressure.

- ✓ Easy to install
- ✓ Resist dislodgment during concrete pouring
- ✓ High elasticity and tensile strength
- ✓ Resists corrosion
- ✓ Swellable
- ✓ Unaffected by acids, alkali, metals salts and other chemicals
